

Information System Project

Analyzing real-world
Information System projects in
the workplace

What is an Information System Project?

- An Information System (IS) project is a planned initiative to develop or improve systems that manage and process data.
- Examples include:
 - - Developing a hospital information system
 - - Building an inventory management application
 - - Creating an e-learning platform

How to Analyze an IS Project

- 1. Project Goals – What is the objective?
- 2. Stakeholders – Who are involved?
- 3. Technologies Used – What platforms/tools are implemented?
- 4. System Modules – What are the core features?
- 5. Impact – What benefits does the system provide?

Example: Student Information System (SIS)

- Goal: To manage student data and academic records
- Stakeholders: Students, lecturers, academic staff
- Technologies: PHP, MySQL, Bootstrap
- Modules: Student registration, grade input, transcript generation
- Impact: Faster academic processing, reduced paperwork
